

From the 22.x version of ORDS, ords.war file must be generated in order to include the configuration directory path.

The command is:

```
ords war <NEW_ORDS.WAR_NAME> (ie: ords war ords_new.war)
```

Before, I set the ORDS_CONFIG environment variable. In my case:

```
export ORDS_CONFIG=/opt/ords/conf
```

When deploying on Tomcat, it should retrieve the path but in my case, it doesn't. I get a 404.

I mean, the behaviour is the same with the original ords.war file or the new one after rebuilding.

So, a possible way is to pass the path url to Java runtime when starting Tomcat.

Add a new file named exactly : `setenv.sh` in `tomcat_home/bin`

In this file, add:

```
export ORDS_CONFIG=/opt/ords/conf
export JAVA_OPTS="-Dconfig.url=${ORDS_CONFIG} -Xms1024M -Xmx1024M"
```

Then, shutdown Tomcat and restart it.
